

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

An English mile from Freistat in Hungary North-ward, is a Quarry of Stone, out of which many great Stones are digged, transparent and

refembling Sugarcandy.

At Banca, two Hungar. miles from Freistat North-ward, is a Quarry of white stone, night he Hot Baths of that place; over which is a lay of Chalk of about a yard thick, very beautiful to the Eye, as being of all colors, except green; so finely mixt, streaked, and shaded, that it surpasseth Marble-paper; and the water dropping upon it, doth as twere varnish it.

At Schemnitz in Hungary, famous for Silver-Mines, is an high perpendicular Rock, part of which, from the top to the bottom, is naturally tinctur'd with a shining fair blew and green: And I have heard from a Spaniard, who lived long in the West-Indies, that there is also a rock, like

this nigh to the Silver-mines in Peru.

The Mountain of Clissura, being a part of Mount Hamus, as also Mount Pyrlipe (both which I pussed over travelling from Belgrade towards Larissa in Thessaly) doe shine like Silver, and day and night, either by the light of the Sun or Moon, afford a glittering pleasant shew, caused by the great quantity of Muscovy glass, wherewith these Hills abound. There are also Talcum-rocks nigh Spitall in upper Carinthia, as I have been informed by M. Donellan, who liveth there. I am unwilling to omit an Hill nigh Sarvizza, two dayes journey on this side Larissa, which consists of an earth of a fine red colour, out of which the red Earthen Vessels of that Country are made; as also the great number of Acidula nigh Transchin in Hungary, there being 32 plentiful springs of them; likewise an Hot Bath nigh Bellachergua in Bulgaria, it being scituated farr from any habitation, yet well built by the Turks, and very refreshing to Travellours. It hath a red sediment, and maketh a gray stone.

Being at Larisa in Thessaly, where the Gr. Segnor hath long resided, I understood, that he had passed a good part of the hot Summer of 1669, upon the neighbouring mount Olympus; and by the Interpreters to the Emperours Resident, the Illustriss Signor di Casa nova, (who were obliged to attend the Sultan upon the mountain) I was informed that there was a Spring of a whitish water upon that Hill, which was drank of by many persons in their great heat and thirst, contracted by ascending the mountain, but proved very destructive unto them in 3 dayes, they then complaining of an heaviness and coldness of their Stomacks till they dyed.

An Account of some Books.

There being lately fallen into our hands three Books written by several Anthours, concerning the Production of the World, all three pretending to assert and confirm what is delivered by Moses in the sirst of Genesis, though they do it different wayes; We thought, it would not be un-accep-

table to the Ingenious, to give them here a taste of these Treatises, thereby to excite them to a further disquisition and elucidation of this matter. We shall herein follow the order of the time, wherein these Books were publisht; and therefore begin with

I. COSMOPOEIA DIVINA, seu Fabrica Mundi explicata, per Ludov. de Beaufort Parisinum Med. Doct. Lugd. Batav. 1656.in 12°.

This Authour having in the Dedication of his Book professed his aversion from devising any other Systeme of the world, than that, which is described by Moses, and having also expressed his labors and endeavours to adjust and accommodate all the Phanomena of Nature to the mind of that Divine Writer, tells us,

In his first Section, that God in the beginning of Time created, in a space before void, Heaven and Earth, or the Matter of both, and of all things comprehended therein, as an unshapen Masse, continued, un-divided, and un-moved: And that afterwards by his divine cherishing and separating power he resolved that dull and moveless matter into moving maters, or divided it into innumerable parts, and put it into motion by that division, and by the introduction of a vacuum; by the means of which impirted motion, the particles began to extricate themselves, to stirre, and to tend to their several places, and to afford the first Rudiments of three Ranks of great Bodies: so that, after the space of 12 hours or thereabout, some Light began to appear, there being then so much of that subrile matter collected, as was sufficient to illuminate a certain medium.

In the second Section, that the Creator formed the Firmament, as a kind of Arched Vaultin the midst of the Waters, that is, more perfectly distinguisht three Ranks or Material Principles of Bodies, viz. one in the middle, the Firmament, and two extreams, retaining the name of Waters but movable and moved: For, since on the first day all the parts began to be gather'd into three Classes, and the grossest to take the lowest place, the less gross, the middlemost, and the sinest, the uppermost, he conceiveth, that the Firmament was well said to have been made this 2d day, for smuch as the Celestial matter was collected in the middle, and placed 'twixt the subtiler, whose place was above, and the thickest Elementary, being below: Which waters were simply so called before, as then actually constituting but one shuid body, but now distinguished into three ranks.

In the third, that the Creator began to subdivide the third rank, or the Elementary matter, (which was yet very Heterogeneous) by gathering together into one place all the Elementary Aqueous particles, which he call'd Seas; so that the Dry began to appear, which he called Earth; resolving and raising upwards into vapors and exhalations the thinner particles, thence to produce Air and Fire; which are the four commonly so called Elements and reputed simple Bodies: out of which the other are compounded, sirst the impersectly mix't, then gradually the more persectly mixt, and after that the Vegetative, which about the end of this day began to be actually produced.

In the fourth, that he made the Sun, Moon and Stars, adorning and perfecting the Heavens. Where the Author thinks it no wonder, that these were not created before the fourth day, in regard there was required more time for the framing (without a new Miracle) so many and such various vortices, thence to form the Heavens and the Stars, than for a simple separation of the Water from the Earth.

In the fifth, that he produced Sensitive and Moving Creatures, of a

lower order, viz. Fish, and Fowle.

In the fixth, that he brought forth the other more perfect Animals, namely the Beafts of the Earth; over which, as over all the rest, the Great and Bountiful Creator set Man, whom he form'd after his own Image, endowing him with a Mind, and constituting him an Epitome of the Universe, and his Lievtenant General and Governour on Earth.

In all which the Author taketh notice of two Soverain Miraculous Works; first, the Production of the Matter of the World out of Nothing; the fecond, the Division and Motion caused in that Matter: declaring, that the other works may be conceived to be produced without a new Miracle in the space of the six dayes, enumerated by Moses. Besides, he takes occasion, to explicate the nature of Motion, and to give the Laws of the same; to shew the necessity of a Vacuum before and in the Formation of the World; and to solve the Arguments alleadged against a Vacuum; In short, to deliver his opinion, concerning all the main parts of Natural Philosophy.

II. CARTESIUS MOSAIZANS, Anth. Joh. Amerpoel. Leowardia 1669. in 12°.

The design of this Author is to make it out, that the Philosophy delivered by the samous Des-Chartes doth well agree, at least not disagree with the History of the Creation, recorded by Moses. A design, which that Eminent Philosopher entertained himself, and would have set upon, if Death had not prevented him, as appears in his Letters to Mersennus, viz. the 24th and 53d of the 2d Tome, where he affirms, that comparing his Principles with the Mosaick History he had found, to his wonder, that the latter could be much better explicated according to the former, than by any other of all those ways, wherein Interpreters have hitherto explain'd it.

To evince this, our Author hath taken the pains to make a parallel between the first Chapt. of Genesis, and the Principles of Des-Chartes,

endeavouring to make it appear.

1. That Moses as well as Des-Chartes did acknowledg in the Corporeal Sphere of things nothing but one Homogeneous and Uniform Matter, divided and diversify'd by Mosion, put into that Matter by the Creator, and preserv'd therein by the same.

2. That both begin their Philosophy from the Consideration of Light.

as the first Effect of the Distinction of things from one another.

3. That both do attribute a Fluidity to the Heavens; yet so, as that Des-Chartes enlarges upon the particular Disposition of the Constituent parts of that Body, which Moses is silent of.

4. That the Cartesian Doctrine of the Distinction of the Earth from the Waters and Air, and of the proper Constitution of each of

them, is not inconsistent with that of Genesis.

5. That the growth and variety of Vegetables, and the causes thereof affign d by Des-Chartes, do not disagree with the same Sacred History.

6. That the Cartesian Doctrine of the Constitution and Use of the Luminaries and Fix't Stars, and their difference from the Planets and Comets; as also that of the Motion of the Earth about the Sun, and its own Axis, and the deflexion of its Axis from the Parallelisme to the Axis of the Ecliptick, and the keeping in a perpetual Parallelisme to itself, is very rational; and consequently not incongruous to that of the

Divine Philosopher.

7. That there is a great agreement between Moses and Des-Cartes in affigning the difference between the Life of Beasts, and the Soul of Man; forasmuch as both teach, that the former consists in the Blond; Which Des-Chartes further declaring, teacheth, That the Bloud heated in the Heart and subtilized into Spirits, is diffused from the Heart and Arteries through the Brain into the Nerves and Muscles and by a continual influx into the same, moves the whole and wonderfully contrived Frame of the Body and all the parts thereof; according to the various impulses and actions of Objects upon them: But that the Soul of Man consists in Thinking and Understanding, whereby principally Man resembleth his Creator, to whose Image he is made. Which difference is confirm'd by what Moses saith, that God commanded the Earth to bring forth Living Creatures or Beasts, as well as he commanded the Earth to produce Plants; whereas, after he had formed Man out of the Earth, he is faid to have breath'd into him the Breath of Life, whereby Man became a Living Soul, not only Living and Moving, but a Soul too, that is, perceiving and knowing.

The third Book, promised in the Contents, we must refer to the next, for

want of room.
